

ASK YOUR DENTIST ABOUT

SEALANTS

AMERICAN ACADEMY OF PEDIATRIC DENTISTRY

What are sealants?

Sealants protect the grooved and pitted surfaces of the teeth, especially the chewing surfaces of back teeth where most cavities in children are found. Made of clear or shaded plastic, sealants are applied to the teeth to help keep them cavity-free.

SEALANT

How do sealants work?

Even if your child brushes and flosses carefully, it is difficult—sometimes impossible—to clean the tiny grooves and pits on certain teeth. Food and bacteria build up in these crevices, placing your child in danger of tooth decay. Sealants “seal out” food and plaque, thus reducing the risk of decay.

How long do sealants last?

Research shows that sealants can last for many years if properly cared for. Therefore, your child will be protected throughout the most cavity-prone years. If your child has good oral hygiene and avoids biting hard objects, sealants will last longer. Your pediatric dentist will check the sealants during routine dental visits and recommend re-application or repair when necessary.

Before sealant is applied.

After sealant is applied.

What is the treatment like?

The application of a sealant is quick and comfortable. It takes only one visit. The tooth is first cleaned. It is then conditioned and dried. The sealant is then flowed onto the grooves of the tooth and allowed to harden or hardened with a special light. Your child will be able to eat right after the appointment.

NTS

How much does it cost?

The treatment is very affordable, especially in view of the valuable decay protection it offers your child. Most dental insurance companies cover sealants. Some companies, however, have age and specific tooth limitations. Check with your benefits provider about your child's coverage and talk to your pediatric dentist about the exact cost of sealants for your child.

Which teeth should be sealed?

The natural flow of saliva usually keeps the smooth surfaces of teeth clean but does not wash out the grooves and fissures. So the teeth most at risk of decay—and therefore, most in need of sealants—are the six-year and twelve-year molars. Many times the permanent premolars and primary molars will also benefit from sealant coverage. Any tooth, however, with grooves or pits may benefit from the protection of sealants. Talk to your pediatric dentist, as each child's situation is unique.

If my child has sealants, are brushing and flossing still important?

Absolutely! Sealants are only one step in the plan to keep your child cavity-free for a lifetime. Brushing, flossing, balanced nutrition, limited snacking, and regular dental visits are still essential to a bright, healthy smile.

The American Academy of Pediatric Dentistry (AAPD)

Founded in 1947, the AAPD is a not-for-profit membership organization representing the specialty of pediatric dentistry. AAPD's 8,000 members are predominately pediatric dentists and primary care providers who deliver comprehensive specialty treatments for infants, children, adolescents and individuals with special health care needs. As advocates for children's oral health, the AAPD aims to promote the use of evidence-based policies and guidelines, foster research concerning pediatric oral health, and educate health care providers and the public to improve children's oral health. For further information, please visit the AAPD website at www.aapd.org.
