

"I see patients from around the world because parents do not want to put their children through the ordeal of general anesthesia, or the post-operative discomfort associated with traditional methods. Whether it is for infants who can't breastfeed or older children with speech problems, Solea has allowed me to do frenectomies gently in my office without anesthesia or discomfort, providing a better experience for both the children and their parents."

—Lawrence Kotlow, DDS, PC

"Nothing is more important to us than the safety, health, and comfort of our patients. By using Solea for frenectomies, from newborns on, there is less inflammation and less scar tissue compared to older methods, including those of other lasers. What's more, procedures with Solea heal so much faster."

—Jared Poplin, DMD

"The advantages of using Solea for soft tissue surgeries, especially for kids, is not having to numb them, not always needing to place sutures, less bleeding during the procedure, and better overall post-operative comfort. The kids do so much better during and after laser procedures. It's a huge benefit for them."

—Andrea Gamble, DDS

S O L E A

TETHERED ORAL TISSUES (TOTs)

A frenum is the connective soft tissue that is present behind the upper lip or underneath the tongue. Tethered oral tissues (TOTs) is the term used when a frenum is too tight and doesn't allow proper movement. You may also hear the term "tie" such as a lip tie or tongue tie. TOTs can make it hard for a child to breastfeed and eat, impair proper facial development, and negatively affect how they breathe, sleep, and even how they talk.

A frenectomy is a procedure to address tethered oral tissues.

SOLEA® FOR TOTs

The SOLEA® All-Tissue Laser enables fast, effective frenectomies, often without the use of a needle for anesthetic. Solea frenectomies have minimal bleeding, minimal post-procedure discomfort, and rapid healing.¹ Newborns can often resume nursing immediately after the procedure.
